

Technical Operations Manual: Project Aethelgard

Document Ref: TD-9928-X | Classification: Confidential (Test Data)

1. System Architecture

The Aethelgard system operates on a decentralized mesh network designed to withstand localized electromagnetic interference. The core processing unit, the **Nexus-9 Core**, utilizes a unique cooling signature to avoid detection by thermal imaging. Unlike standard silicon-based processors, the Nexus-9 employs a *gallium-nitride substrate*.

Key Concept: The efficiency of the heat dissipation is calculated using the formula $\eta = (T_h - T_c) / T_h$, where T_h is the core temperature and T_c is the ambient coolant temperature.

2. Operational Specifications

Component	Identifier	Standard Value	Critical Threshold
Primary Capacitor	CAP-77-Alpha	450 mF	> 525 mF
Signal Oscillator	OSC-B2	14.2 GHz	< 12.0 GHz
Fusion Regulator	REG-9	98.4% Efficiency	< 92.0% Efficiency

3. Maintenance Protocol (Level 3 Access)

Scheduled maintenance must be performed every 400 operational hours. Failure to comply results in the automatic locking of the **Solenoid Gate-4**.

- Step 1:** Deactivate the magnetic resonance field using the blue lever in Sector 7G.
- Step 2:** Replace the synthetic sapphire bearings in the main centrifuge.
- Step 3:** Recalibrate the photon emitters to a wavelength of $\lambda = 450 \text{ nm}$.

4. Troubleshooting and FAQs

Q: Why is the magenta LED blinking in a 3-short, 1-long pattern?

This indicates a **Sub-harmonic Resonance Imbalance**. This specific code (Error 404-Resonance) means the dampers in the lower chassis have reached 90% wear capacity. You must vent the excess gas through the *Emergency Scrubber* before attempting a restart.

Q: What should I do if the "Blue Sky" protocol is initiated?

This protocol is only triggered during a total coolant failure. Technicians should immediately evacuate the sub-level and engage the **Liquid Nitrogen Flood** from the remote terminal located in the Security Bunker (Room 101).
